GEMM leaderboard

One kernel, every workload. Each row is a **single run**: all four numbers come from the same kernel, so a kernel has to be fast at the square GEMM, at N=1 (matrix-vector, the language model's case), at N=32 *and* on TinyStories at once. Optimizing for just one of them won't do. You should pick the run shown here on your page (☆ next to the run); until you do, it's your run with the highest tok/s.

Leaderboard deadline: 09 Oct 2026, 11:05 PM IST. Runs queued after it are still graded but won't count for the leaderboard.

Click a column to rank by it. 0 job(s) in the queue.

rank	roll	square 768^3 (ms)	N=1 total (ms)	N=32 total (ms)	TinyStories tok/s ▼
1	2023111019	6.451	3.212	4.384	118.72
2	2023112003	4.002	3.208	3.581	117.57
